Construction Industry: Workers' Compensation Insights

Key Observations

Construction and mining labourers, including brick layers, electricians, carpenters and truck drivers face a heightened risk of injury. The data indicates that a significant portion of these injuries is attributed to Traumatic joint/ligament and muscle/tendon injury (36.25%), Wounds, lacerations, amputations and internal organ damage (28.12%), Musculoskeletal and connective tissue diseases (11.41%) and fractures (10.63%). The majority of injuries stem from body stressing (32.10%), falls, trips and slips of a person (25%) and being hit by moving object (22.53%). Furthermore, the data shows a higher percentage of claims among our younger workforce up to 44 years, while the fatality rate is notably higher in the 45 to 64 age group. The most fatalities occur among construction and mining labourers (64), miscellaneous labourers (37) and electricians (31). We continue to observe an upward trend in the number of worker's compensation claims, median time lost, and median compensation paid, all of which directly impact an organisation's premiums and financial performance.
